

COMMAND CENTER

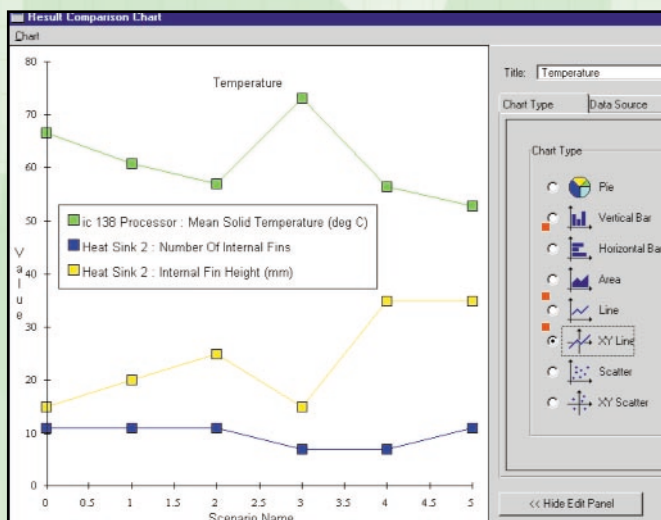

Rapid Design Optimization

At the heart of Flomerics software is a specialist software module called 'Command Center'. The Command Center automates the analysis of multiple design scenarios, and enables the engineer to identify the optimum solution quickly and easily.

Performing 'what-if' studies has always been an essential part of the engineering design process. Traditionally, this has been a time-consuming process involving setting up individual case files for each change, running each case independently, and then measuring the performance of one design against another. Flomerics developed the Command Center to simplify and automate this entire process.

Another powerful feature of the Command Center is its ability to detect and utilize idle CPU resources on a computer network. Using this feature you can dramatically reduce the analysis execution time producing a corresponding increase in your productivity.

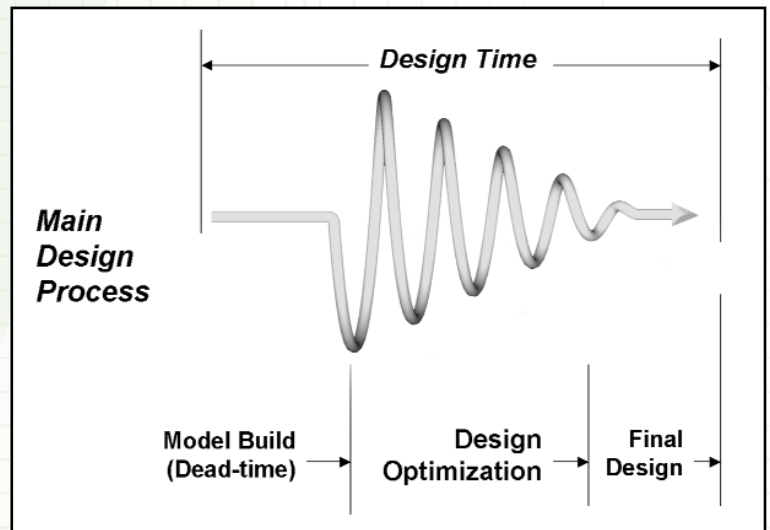

Since 1988, Flomerics has pioneered a different approach to numerical analysis and simulation.

Flomerics' software tools and services help bridge the gap between science and industry by embedding complex analysis and optimization software deeply into the design process, in a way which enhances productivity in engineering design. This approach is called "Design-Class Analysis".

COMMAND CENTER

In summary, the Command Center enables engineers to:

- Compare key performance criteria of different designs directly with each other.
- Identify the optimal design quickly.
- Use automatic job scheduling and control to make crude batch processing a thing of the past.
- Make more effective use of networked computer resources that might otherwise sit idle.
